

<b>About section of a profiler</b>
<b>Name of the profiler</b>
DNA binding by OECD
<b>Developer; Donator; date; version</b>
<p><b>Developer:</b> School of Pharmacy and Chemistry, Liverpool John Moores University, UK</p> <p><b>Donator:</b> European Chemicals Agency (ECHA); Organization for Economic Co-operation and Development (OECD)</p> <p><b>Version:</b> 2.3 December 2016</p>
<b>Relevance/Applicability to endpoint(s)</b>
This profiler is intended to be used for the assessment of endpoints in which covalent binding to DNA has been shown to be the molecular initiating event for low molecular weight chemicals. The profiler has been developed from mechanistic knowledge of the electrophilic chemistry of covalent DNA binding – importantly it has been developed from a systematic review of the literature and not from the analysis of a single toxicological dataset.
<b>Relevance/Applicability to particular chemical classes</b>
This profiler is applicable only to organic chemicals that have a molecular weight less than 1000 g/mol. It is applicable only to the chemical classes for which it contains structural alerts; the absence of a structural alert should not be taken as an absence of toxicity.
<b>Approach used to develop the profiler - Concise but informative description of:</b>
a) The aim of the profiler was to identify structural alerts associated with organic, low molecular weight chemicals capable of forming covalent bonds with DNA. The structural alerts were derived from knowledge of the molecular initiating event - covalently binding to DNA. It was developed from a systematic review of the literature, rather than from the analysis of a single toxicological dataset.
b) The profiler was developed from a mechanistic rationale that the molecular initiating event for covalent bond formation with DNA. Importantly, this was achieved by reviewing the literature relating to the chemistry, rather than an analysis of toxicological datasets.
c) The profiler was developed from an extensive review of the literature relating to the chemistry of covalent bond formation with DNA. A full list of the literature included can be found in the reference listed in section d.
d) An overview of the mechanistic chemistry and underlying principles of the structural alerts within this profiler can be found in: Enoch et al (2010) <i>A review of the electrophilic reaction chemistry involved in covalent DNA binding</i> . Critical Reviews in Toxicology, 40, p728-748
<b>Summary description of profiles/alerts within the profiler</b>
It is not possible to provide metrics relating to this profiler as it was not developed from an analysis of toxicological datasets. It was developed from an extensive review of the chemistry related to the formation of a covalent bond between a low molecular weight chemical and DNA.
<b>Similar to other profilers</b>
A number of related endpoint specific profilers exist in the OECD QSAR Toolbox relating to genotoxicity. The <i>DNA binding by OECD</i> profiler should be used first, with endpoint specific profilers (which have been developed from an analysis of toxicological data) being used to sub-categorise, where possible.

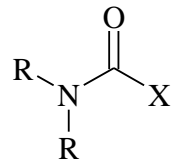

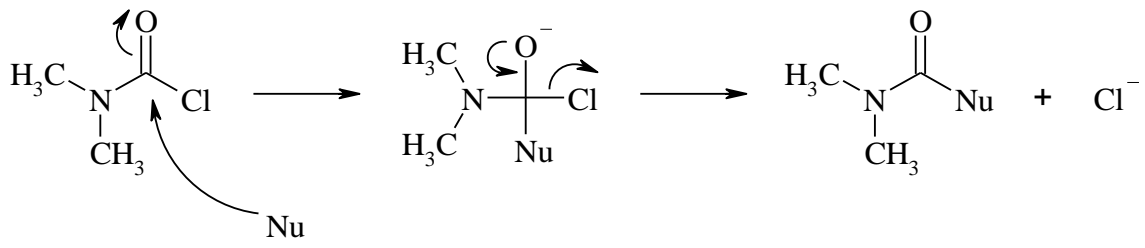

**Short description of update version**

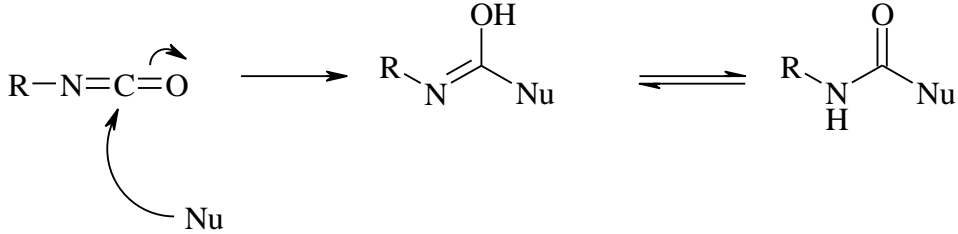

SMARTS language for describing molecular patterns, i.e. structural boundaries, structural alerts has been implemented in OECD QSAR Toolbox 4.0. As a result *DNA binding by OECD* profiler has been rewritten but without modifying the knowledge it is based on. Distinctions are expected in the profiling results between Toolbox v.3.4 and v 4.0 due to different interpretation of the molecular structures, e.g. for heterocyclic/heteroaromatic compounds and the new 2D redactor which allows to define the structure boundaries more correctly according to the description of the categories. An example for category with possible inconsistencies between TB 3.4 and TB 4.0 is the Aromatic azo category. The profiling results in TB 4.0 are expected to be more accurate than these of TB 3.4.

**Disclaimer**

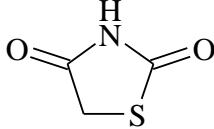

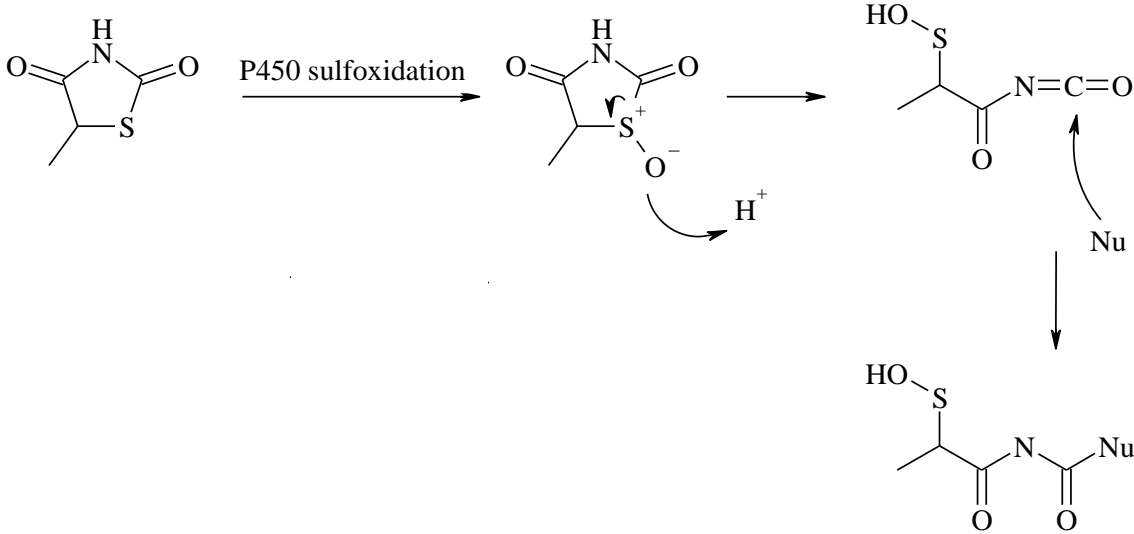

The structural boundaries used to define the chemical classes (e.g. “Alcohol” – chemical class from “Organic functional group” profiler) or alerting groups responsible for the binding with biological macromolecules (e.g. “Aldehydes” – structural alert for protein binding), represent structural functionalities in the molecule which could be used for building chemical categories for subsequent data gap filling. They are not recommended to be used directly for prediction purposes (as SARs).

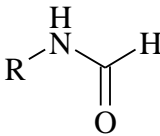

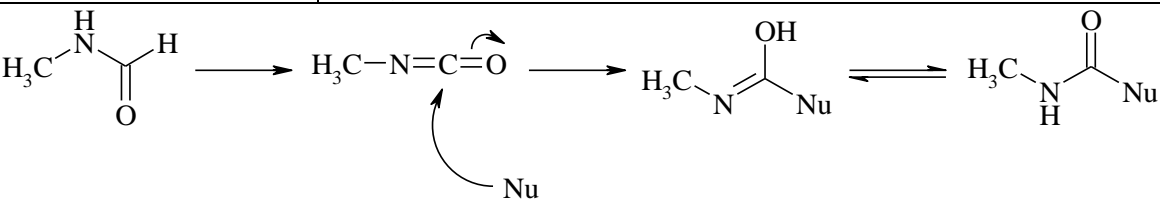

Individual profile/alert	
<b>Name</b>	Acyl halide
<b>Type of profile</b>	Structural alert
<b>Description/applicability domain</b>	$\begin{array}{c} \text{O} \\ \parallel \\ \text{R}-\text{C}-\text{X} \end{array}$ <p>X = halogen R = any carbon, hydrogen</p>
<b>Mechanism</b>	An acylation mechanism has been suggested to be responsible for the ability of acyl halides to bind to DNA macromolecules (Enoch et al 2010).
	<p>Nu = biological nucleophile</p>
<b>Set of chemicals used for profile development</b>	N/A – all structural alerts in this profiler were developed from a review of the electrophilic chemistry associated with covalent DNA binding rather than an analysis of toxicological data. The alerts define the chemistry for endpoints where covalent binding to DNA is the molecular initiating event.
<b>Data/Knowledge used for profile development</b>	An extensive review of the literature was performed enabling the chemistry associated with covalent binding to DNA to be defined and encoded in this profiler.
<b>Performance of the profile / or Analysis of the profile (for each endpoint for the endpoint specific profilers)</b>	N/A – all alerts in this profiler were developed from a review of the chemistry associated with covalent DNA binding. Individual toxicological datasets were not analysed during the development of the alerts within this profiler.

Individual profile/alert	
<b>Name</b>	Alkyl carbamyl halides
<b>Type of profile</b>	Structural alert
<b>Description/applicability domain</b>	 <p>R = any carbon, hydrogen X = F, Cl, Br, I</p>
<b>Mechanism</b>	An acylation mechanism has been suggested as being responsible for the formation of DNA adducts (Enoch et al 2010).
	 <p>Nu = biological nucleophile</p>
<b>Set of chemicals used for profile development</b>	N/A – all structural alerts in this profiler were developed from a review of the electrophilic chemistry associated with covalent DNA binding rather than an analysis of toxicological data. The alerts define the chemistry for endpoints where covalent binding to DNA is the molecular initiating event.
<b>Data/Knowledge used for profile development</b>	An extensive review of the literature was performed enabling the chemistry associated with covalent binding to DNA to be defined and encoded in this profiler.
<b>Performance of the profile / or Analysis of the profile (for each endpoint for the endpoint specific profilers)</b>	N/A – all alerts in this profiler were developed from a review of the chemistry associated with covalent DNA binding. Individual toxicological datasets were not analysed during the development of the alerts within this profiler.

Individual profile/alert	
<b>Name</b>	Isocyanates
<b>Type of profile</b>	Structural alert
<b>Description/applicability domain</b>	$\text{R}-\text{N}=\text{C}=\text{O}$ R = any carbon, hydrogen
<b>Mechanism</b>	An acylation mechanism has been suggested as being responsible for the formation of DNA adducts (Enoch et al 2010).
	 <p style="text-align: center;">Nu = biological nucleophile</p>
<b>Set of chemicals used for profile development</b>	N/A – all structural alerts in this profiler were developed from a review of the electrophilic chemistry associated with covalent DNA binding rather than an analysis of toxicological data. The alerts define the chemistry for endpoints where covalent binding to DNA is the molecular initiating event.
<b>Data/Knowledge used for profile development</b>	An extensive review of the literature was performed enabling the chemistry associated with covalent binding to DNA to be defined and encoded in this profiler.
<b>Performance of the profile / or Analysis of the profile (for each endpoint for the endpoint specific profilers)</b>	N/A – all alerts in this profiler were developed from a review of the chemistry associated with covalent DNA binding. Individual toxicological datasets were not analysed during the development of the alerts within this profiler.

Individual profile/alert	
<b>Name</b>	Isothiocyanates
<b>Type of profile</b>	Structural alert
<b>Description/applicability domain</b>	$R-N=C=S$ R = any carbon, hydrogen
<b>Mechanism</b>	An acylation mechanism has been suggested as being responsible for the formation of DNA adducts (Enoch et al 2010).
<p style="text-align: center;">Nu = biological nucleophile</p>	
<b>Set of chemicals used for profile development</b>	N/A – all structural alerts in this profiler were developed from a review of the electrophilic chemistry associated with covalent DNA binding rather than an analysis of toxicological data. The alerts define the chemistry for endpoints where covalent binding to DNA is the molecular initiating event.
<b>Data/Knowledge used for profile development</b>	An extensive review of the literature was performed enabling the chemistry associated with covalent binding to DNA to be defined and encoded in this profiler.
<b>Performance of the profile / or Analysis of the profile (for each endpoint for the endpoint specific profilers)</b>	N/A – all alerts in this profiler were developed from a review of the chemistry associated with covalent DNA binding. Individual toxicological datasets were not analysed during the development of the alerts within this profiler.

Individual profile/alert	
<b>Name</b>	Thiazolidinediones
<b>Type of profile</b>	Structural alert
<b>Description/applicability domain</b>	
<b>Mechanism</b>	The most likely mechanism for DNA binding that has been suggested involves a P450 mediated sulfoxidation. This reactive intermediate species then undergoes ring scission to produce an isocyanate. This isocyanate undergoes an acylation mechanism with a biological nucleophile such as DNA (Enoch et al 2010).
 <p style="text-align: center;">Nu = biological nucleophile</p>	
<b>Set of chemicals used for profile development</b>	N/A – all structural alerts in this profiler were developed from a review of the electrophilic chemistry associated with covalent DNA binding rather than an analysis of toxicological data. The alerts define the chemistry for endpoints where covalent binding to DNA is the molecular initiating event.
<b>Data/Knowledge used for profile development</b>	An extensive review of the literature was performed enabling the chemistry associated with covalent binding to DNA to be defined and encoded in this profiler.
<b>Performance of the profile / or Analysis of the profile (for each endpoint for the endpoint specific profilers)</b>	N/A – all alerts in this profiler were developed from a review of the chemistry associated with covalent DNA binding. Individual toxicological datasets were not analysed during the development of the alerts within this profiler.

Individual profile/alert	
<b>Name</b>	Formamides
<b>Type of profile</b>	Structural alert
<b>Description/applicability domain</b>	 <p style="text-align: center;">R = any carbon, hydrogen</p>
<b>Mechanism</b>	<p>Formamides have been suggested to be metabolised by P450 into reactive isocyanate species. Isocyanates have been shown to be able to covalently bind to DNA via an acylation mechanism (Enoch et al 2010).</p>  <p style="text-align: center;">Nu = biological nucleophile</p>
<b>Set of chemicals used for profile development</b>	N/A – all structural alerts in this profiler were developed from a review of the electrophilic chemistry associated with covalent DNA binding rather than an analysis of toxicological data. The alerts define the chemistry for endpoints where covalent binding to DNA is the molecular initiating event.
<b>Data/Knowledge used for profile development</b>	An extensive review of the literature was performed enabling the chemistry associated with covalent binding to DNA to be defined and encoded in this profiler.
<b>Performance of the profile / or Analysis of the profile (for each endpoint for the endpoint specific profilers)</b>	N/A – all alerts in this profiler were developed from a review of the chemistry associated with covalent DNA binding. Individual toxicological datasets were not analysed during the development of the alerts within this profiler.

Individual profile/alert	
<b>Name</b>	Sulfonylureas
<b>Type of profile</b>	Structural alert
<b>Description/applicability domain</b>	 <p>R = any carbon, hydrogen</p>
<b>Mechanism</b>	<p>Sulfonylureas have been suggested to be metabolised via amide bond cleavage to produce reactive isocyanate species. Isocyanates have been demonstrated to covalently bind to DNA via a acylation mechanism (Enoch et al 2010).</p>  <p>Nu = biological nucleophile</p>
<b>Set of chemicals used for profile development</b>	N/A – all structural alerts in this profiler were developed from a review of the electrophilic chemistry associated with covalent DNA binding rather than an analysis of toxicological data. The alerts define the chemistry for endpoints where covalent binding to DNA is the molecular initiating event.
<b>Data/Knowledge used for profile development</b>	An extensive review of the literature was performed enabling the chemistry associated with covalent binding to DNA to be defined and encoded in this profiler.
<b>Performance of the profile / or Analysis of the profile (for each endpoint for the endpoint specific profilers)</b>	N/A – all alerts in this profiler were developed from a review of the chemistry associated with covalent DNA binding. Individual toxicological datasets were not analysed during the development of the alerts within this profiler.

Individual profile/alert	
<b>Name</b>	Benzylamines
<b>Type of profile</b>	Structural alert
<b>Description/applicability domain</b>	
<b>Mechanism</b>	Benzylamines have been shown to be metabolised into several reactive species capable of covalently binding to biological nucleophiles via an acylation mechanism (Enoch et al 2010).
 <p style="text-align: center;">Nu = biological nucleophile</p>	
<b>Set of chemicals used for profile development</b>	N/A – all structural alerts in this profiler were developed from a review of the electrophilic chemistry associated with covalent DNA binding rather than an analysis of toxicological data. The alerts define the chemistry for endpoints where covalent binding to DNA is the molecular initiating event.
<b>Data/Knowledge used for profile development</b>	An extensive review of the literature was performed enabling the chemistry associated with covalent binding to DNA to be defined and encoded in this profiler.
<b>Performance of the profile / or Analysis of the profile (for each endpoint for the endpoint specific profilers)</b>	N/A – all alerts in this profiler were developed from a review of the chemistry associated with covalent DNA binding. Individual toxicological datasets were not analysed during the development of the alerts within this profiler.

Individual profile/alert	
<b>Name</b>	1,1-Dihaloalkanes
<b>Type of profile</b>	Structural alert
<b>Description/applicability domain</b>	$\begin{array}{c} \text{X} \\   \\ \text{R}-\text{C}-\text{X} \\   \\ \text{H} \end{array}$ <p>R = any carbon X = halide</p>
<b>Mechanism</b>	P450 mediated oxidative dehalogenation into an acyl halide has been suggested to be responsible for the toxicity of 1,1-dihaloalkanes. The acyl halide is able to bind DNA via an acylation mechanism (Enoch et al 2010).
	<p style="text-align: center;">Nu = biological nucleophile</p>
<b>Set of chemicals used for profile development</b>	N/A – all structural alerts in this profiler were developed from a review of the electrophilic chemistry associated with covalent DNA binding rather than an analysis of toxicological data. The alerts define the chemistry for endpoints where covalent binding to DNA is the molecular initiating event.
<b>Data/Knowledge used for profile development</b>	An extensive review of the literature was performed enabling the chemistry associated with covalent binding to DNA to be defined and encoded in this profiler.
<b>Performance of the profile / or Analysis of the profile (for each endpoint for the endpoint specific profilers)</b>	N/A – all alerts in this profiler were developed from a review of the chemistry associated with covalent DNA binding. Individual toxicological datasets were not analysed during the development of the alerts within this profiler.

Individual profile/alert	
<b>Name</b>	$\alpha,\beta$ -Unsaturated aldehydes
<b>Type of profile</b>	Structural alert
<b>Description/applicability domain</b>	 <p>R1 = any carbon atom (except aromatic systems), hydrogen</p>
<b>Mechanism</b>	An initial Michael addition mechanism has been suggested to be primarily responsible for the ability of $\alpha,\beta$ -unsaturated aldehydes to alkylate DNA. A subsequent Schiff base reaction at the carbonyl can result in cross linked DNA adducts (Enoch et al 2010).
	 <p>Nu = biological nucleophile</p>
<b>Set of chemicals used for profile development</b>	N/A – all structural alerts in this profiler were developed from a review of the electrophilic chemistry associated with covalent DNA binding rather than an analysis of toxicological data. The alerts define the chemistry for endpoints where covalent binding to DNA is the molecular initiating event.
<b>Data/Knowledge used for profile development</b>	An extensive review of the literature was performed enabling the chemistry associated with covalent binding to DNA to be defined and encoded in this profiler.
<b>Performance of the profile / or Analysis of the profile (for each endpoint for the endpoint specific profilers)</b>	N/A – all alerts in this profiler were developed from a review of the chemistry associated with covalent DNA binding. Individual toxicological datasets were not analysed during the development of the alerts within this profiler.

Individual profile/alert	
<b>Name</b>	3-Methylindole derivatives
<b>Type of profile</b>	Structural alert
<b>Description/applicability domain</b>	
<b>Mechanism</b>	P450 dehydrogenation results in an imine-methide intermediate capable of undergoing Michael addition with biological nucleophiles (Enoch et al 2010).
 <p style="text-align: center;">Nu = biological nucleophile</p>	
<b>Set of chemicals used for profile development</b>	N/A – all structural alerts in this profiler were developed from a review of the electrophilic chemistry associated with covalent DNA binding rather than an analysis of toxicological data. The alerts define the chemistry for endpoints where covalent binding to DNA is the molecular initiating event.
<b>Data/Knowledge used for profile development</b>	An extensive review of the literature was performed enabling the chemistry associated with covalent binding to DNA to be defined and encoded in this profiler.
<b>Performance of the profile / or Analysis of the profile (for each endpoint for the endpoint specific profilers)</b>	N/A – all alerts in this profiler were developed from a review of the chemistry associated with covalent DNA binding. Individual toxicological datasets were not analysed during the development of the alerts within this profiler.

Individual profile/alert	
<b>Name</b>	Furans
<b>Type of profile</b>	Structural alert
<b>Description/applicability domain</b>	 <p>R = hydrogen, any carbon except the following  R ≠ -NHR1 (R1 = any carbon, oxygen, hydrogen), -N(R1)<sub>2</sub> (R1 = any combination of methyl or ethyl), -NO<sub>2</sub>, -NO, -N=NR1 (R1 = any carbon, hydrogen)</p>
<b>Mechanism</b>	A cytochrome P450 mediated ring opening reaction producing a reactive dial capable of undergoing Michael addition has been proposed (Enoch et al 2010).
 <p>Nu = biological nucleophile</p>	
<b>Set of chemicals used for profile development</b>	N/A – all structural alerts in this profiler were developed from a review of the electrophilic chemistry associated with covalent DNA binding rather than an analysis of toxicological data. The alerts define the chemistry for endpoints where covalent binding to DNA is the molecular initiating event.
<b>Data/Knowledge used for profile development</b>	An extensive review of the literature was performed enabling the chemistry associated with covalent binding to DNA to be defined and encoded in this profiler.
<b>Performance of the profile / or Analysis of the profile (for each endpoint for the endpoint specific profilers)</b>	N/A – all alerts in this profiler were developed from a review of the chemistry associated with covalent DNA binding. <b>Name</b>	Alkyl carbamates
<b>Type of profile</b>	Structural alert
<b>Description/applicability domain</b>	 <p style="text-align: center;">R = any carbon or hydrogen</p>
<b>Mechanism</b>	The most likely mechanism leading to adduct formation has been suggested to be an S <sub>N</sub> 2 alkylation reaction (Enoch et al 2010).
	 <p style="text-align: center;">Nu = biological nucleophile</p>
<b>Set of chemicals used for profile development</b>	N/A – all structural alerts in this profiler were developed from a review of the electrophilic chemistry associated with covalent DNA binding rather than an analysis of toxicological data. The alerts define the chemistry for endpoints where covalent binding to DNA is the molecular initiating event.
<b>Data/Knowledge used for profile development</b>	An extensive review of the literature was performed enabling the chemistry associated with covalent binding to DNA to be defined and encoded in this profiler.
<b>Performance of the profile / or Analysis of the profile (for each endpoint for the endpoint specific profilers)</b>	N/A – all alerts in this profiler were developed from a review of the chemistry associated with covalent DNA binding. Individual toxicological datasets were not analysed during the development of the alerts within this profiler.

Individual profile/alert	
<b>Name</b>	Aliphatic halides
<b>Type of profile</b>	Structural alert
<b>Description/applicability domain</b>	$\begin{array}{c} \text{R} \\   \\ \text{R}-\text{C}-\text{X} \\   \\ \text{H} \end{array}$ <p>R = hydrogen, any carbon except the following:  R ≠ carbonyl (these chemicals fall under the α-halocarbonyl alert) -CS,  -CN (these chemicals fall under the mustards alert)  X = halogen</p>
<b>Mechanism</b>	An S <sub>N</sub> 2 mechanism has been proposed as the primary method of DNA alkylation (Enoch et al 2010).
	<p>Nu = biological nucleophile</p>
<b>Set of chemicals used for profile development</b>	N/A – all structural alerts in this profiler were developed from a review of the electrophilic chemistry associated with covalent DNA binding rather than an analysis of toxicological data. The alerts define the chemistry for endpoints where covalent binding to DNA is the molecular initiating event.
<b>Data/Knowledge used for profile development</b>	An extensive review of the literature was performed enabling the chemistry associated with covalent binding to DNA to be defined and encoded in this profiler.

Individual profile/alert	
<b>Name</b>	Halogenated polarised alkenes (S <sub>N</sub> 2)
<b>Type of profile</b>	Structural alert
<b>Description/applicability domain</b>	 <p>R = any carbon, hydrogen, halogen X = F, Cl, Br, I</p>
<b>Mechanism</b>	It has been suggested that monohalo alkenes are metabolised by CYP P450 initially into epoxides. These chemical can either directly bind to DNA or can undergo rapid rearrangement to an equally DNA reactive polarised aldehyde (binding via an S <sub>N</sub> 2 mechanism) (Enoch et al 2010).
	 <p>Nu = biological nucleophile</p>
<b>Set of chemicals used for profile development</b>	N/A – all structural alerts in this profiler were developed from a review of the electrophilic chemistry associated with covalent DNA binding rather than an analysis of toxicological data. The alerts define the chemistry for endpoints where covalent binding to DNA is the molecular initiating event.
<b>Data/Knowledge used for profile development</b>	An extensive review of the literature was performed enabling the chemistry associated with covalent binding to DNA to be defined and encoded in this profiler.
